Profile

AI researcher and Head of Product at Workshop Labs with international competition wins, published research, and technical writing reaching 2.1 million readers. Competition achievements include Bloomberg Trading Challenge (Top 10 globally of 1,000 teams), UK government AI hackathon winner, and Torus Prize for AI safety research. Published research in multi-agent systems achieving state-of-the-art performance. Invited as expert judge at multiple AI competitions, previously founded AI research startup (Y Combinator AI Startup School), currently building personalised language models as founding engineer at a frontier lab.

Education

- | | |
|-----------|---|
| 2023—2024 | Master of Science (MSc), Artificial Intelligence
King's College London, UK <ul style="list-style-type: none">Modules: Pattern Recognition and Deep Learning, Data Mining, Agents and Multi-Agent Systems, AI Planning, Computer Vision, Optimisation Methods, Machine Learning |
| 2020—2023 | Bachelor of Science (BSc). Economics and Management Sciences with Honours,
University of Southampton, UK <ul style="list-style-type: none">Modules: Applied Macroeconomics, Risk Management, Industrial Economics, International Trade, Development Economics, Mathematics for Economics |
| 2013—2020 | Beechen Cliff School and Sixth Form, Bath <ul style="list-style-type: none">A Levels: Economics A*, Physics A, Mathematics A, EPQ on 'Disrupting Monopolies' A*GCSEs: 9 (A - A*/9) and Distinction* for HPQ on 'Graphical Storytelling' |

Academic Excellence

- First Class Honours (1:1), MSc Artificial Intelligence, King's College London (2024)
- Distinction grades in: Dissertation (81%), Computer Vision (89%), Agents & Multi-Agent Systems (77%), AI Reasoning (74%).
- First Class Honours (1:1), BSc Economics and Management Sciences, University of Southampton (2023)
- Dissertation grade: 87% (Distinction).
 - Recognised in Dean's address for contributions to the university after Bloomberg Competition achievement.
- 2x Dean's Award for Outstanding Achievement, University of Southampton (2022 & 2023)
- Recognized as top-performing student in cohort, mentioned in Graduate Honours
- StabilityAI Researcher Sponsorship – CogX Festival (August 2023)
- Invited with sponsored attendance at leading AI conference by Stability AI (frontier lab behind Stable Diffusion)

Research Papers

- “Multi-agents Improve Complex Long-Horizon Task Performance”, Kings College London, Sept 2024
- Developed Nominate: a novel multi-agent system achieving state-of-the-art performance on AgentBench KnowledgeGraph benchmark with 22.3% accuracy improvement and 25.9% reduced token usage. Advisor – Dr. Yulan He (Alan Turing Institute)
 - Introduced new analytical framework for modeling inter-agent dynamics and task decomposition in cooperative AI systems, advancing theoretical understanding of optimal role allocation in multi-agent environments.
 - Demonstrated how strategic agent specialisation and communication protocols enable superior performance on complex reasoning tasks requiring long-horizon planning. Research contributes to the field's understanding of how AI systems can coordinate effectively on problems beyond single-agent capabilities and reason in-context, later displayed by the o1 scaling paradigm.
- “The Threat of Automation: An Economic Perspective,” Dissertation Review, Mar 16, 2023.
- Performed an assessment of methods of predicting economic impact of machine learning on Full Automation of Labour using PIAAC surveys and GEM labor statistics to measure economic risk.
 - Proposed a general model for evaluating ‘risk of automation’ to upgrade policymaker precision when navigating the capital benefits of technological change. Integrated PIAAC survey data with EC/OECD and GEM labor statistics to quantify automation risk across occupation categories, with particular focus on identifying jobs resilient to technological displacement.
 - Analysed conditions for "labor immiseration" scenarios, finding that capital-labor substitution elasticity below 1.0 prevents complete displacement, and that entrepreneurial/self-employed occupations demonstrate resistance to automation.

International & National Competitions

Torus Prize Winner — Mechanistic Interpretability Hackathon, Entrepreneurs First (Apr. 2025)

- Advanced research in AI safety and model interpretability, recognised by leading UK startup accelerator.

Winner — 10x Downing Street AI Hackathon (Feb. 2024)

- Led Imperial College London team building MiDAS (government document search system); selected to present winning solution to senior UK government officials at 11 Downing Street.
- System employed high-performance embeddings for semantic search across government correspondence with automated triaging for officials within gov.

Global Top 10 Winner (of 1,000 teams) — Bloomberg Quantitative Trading Challenge (Nov. 2022)

- Ranked in top 1% globally (Top 5 in Europe) competing against university teams worldwide (including Harvard and MIT); developed systematic trading strategy generating 18% monthly returns through fundamental analysis and indicator optimisation.

2x Winner — 3-Day Startup (3DS) Competition, Barclays Eagle Labs (Winter 2021 & 2022)

- Back-to-back victories in an intensive startup accelerator program sponsored by major UK bank.

Overall Winner — ECSS Pico Hackathon (May 2022)

- First place in the Electronics and Computer Science Society competition 2022. Developed a pathfinding algorithm using satellite data to determine route efficiency.

Leadership and Peer Recognition

Invited as Expert Judge — Defensive Acceleration (Def/Acc) Hackathon, BlueDot Impact (Nov. 2025)

- AI safety and alignment-focused competition.
- Held at London Initiative for Safe AI (LISA).

Invited as Expert Judge — Daedalus Hackathon with Vibe Kanban (Oct. 2025)

- Autonomous systems and MCP protocol development.

Invited as Expert Judge — Cyber Security Hackathon at Entrepreneurs First (Sep. 2025)

- Cyber Security Hackathon held by BlueDot Impact, hosted at Entrepreneurs First.

AI Startup School, Y Combinator, San Francisco (Jul. 2025)

- Competitive international program for AI researchers (travel sponsored); participated with Real Machines.
- Talks from Elon Musk, Sam Altman, Satya Nadella, John Jumper, Andrej Karpathy.

Judge — Iterate Hackathon (Apr. 2025)

- Product development and rapid prototyping competition

Technical Writing — oscarmoxon.com

- Authored technical essays on AI, economics, and civilisational development reaching an international audience of researchers, entrepreneurs, and policymakers. Notable publications:
 - "The Most Profitable Algorithm" (March 2025) — Analysis of AI-driven entrepreneurship and autonomous value creation systems operating at civilizational scale
 - "A Society of Rick Rubins" (February 2025) — Vision for AI-augmented knowledge work where humans transition from execution to orchestration roles
 - "Pervasive Machines: Three Stages of Superintelligence" (April 2023) — Staged AGI development model analysing societal implications from composite tools to post-biological intelligence

Editorial Work

- Editor for "The Intelligence Curse" by Rudolf Laine and Luke Drago (featured in TIME Magazine among other outlets) and "Technocalvinism" by Luke Drago.
- Provided substantive editorial guidance on influential essays exploring AI development, intelligence enhancement, and technological ethics, working with Workshop Labs co-founders on pieces that shaped public discourse.

Professional Experience

Founding Engineer, **Workshop Labs**, London & San Francisco (Aug. 2025 – Present)

- Head of Product and employee #1 at AI frontier lab building personalised language model finetunes aligned to individuals (\$3M pre-seed round, \$50M valuation).
- Architected and built a complete user-facing product platform from inception, serving as lead product engineer during a critical early development phase across San Francisco and London operations.
- Designed and implemented real-time synchronisation infrastructure connecting user data sources (Gmail, Google Drive, Calendar, Notion, Substack, LinkedIn) to enable personalised AI model training while maintaining privacy guarantees in encrypted enclaves (Trusted Execution Environments).
- Engineered OAuth 2.0 integration layer and webhook architecture enabling seamless authentication and real-time context updates across distributed systems.

Founder, **Real Machines**, London (Aug. 2024 – Aug. 2025)

- Founded and led an AI research company developing self-driving software systems, with operations spanning London and San Francisco (selected for Y Combinator AI Startup School cohort).

- ❑ Developed Onbox: universal context management layer for AI systems enabling intelligent information routing and selective data sharing, addressing fundamental challenges in multi-agent coordination.
- ❑ Development autonomous code generation systems capable of end-to-end software development with minimal human supervision. Recruited technical team for early-stage venture.

Principal Consultant, London (May 2023 – Aug. 2024)

- ❑ Advanced software consulting for recruiting technology and financial services clients.
- ❑ Engineered human-in-the-loop CV processing system deployed across recruiting industry, achieving 5-10x productivity improvement for professional recruiters while increasing output quality by 20% through LLM-powered automation.
- ❑ Developed agentic portfolio management analyst using tool-wielding language models for real-time market analysis, enabling natural language financial queries with programmatic data access—demonstrated at a16z × Mistral AI hackathon and used by 70,000 industry professionals on Illio Portfolio Management product.
- ❑ Advised Pickfords International (major logistics company) on AI transformation strategy, conducting comprehensive systems analysis and designing implementation roadmap for ML-powered optimisation infrastructure.
- ❑ Deployed production applications on Azure Cloud infrastructure with full-stack engineering (React frontends, Python/Node.js backends, vector databases for semantic search).

Research Intern — Innovative Technology, **BAE Systems**, London (Easter 2023)

- ❑ Conducted research on centralized data infrastructure, proposing architecture improvements to reduce decision-making latency in mission-critical systems.
- ❑ Investigated internal systems integration challenges and developed recommendations for UK defense contractor's technology modernisation initiative.

Research Student, **QuantX Investment Research Group**, Southampton (May – Nov. 2022)

- ❑ Research directly contributed to Top 10 global finish (out of 1,000 university teams) in Bloomberg Trading Challenge with 18% monthly returns on hedged portfolio.
- ❑ Quantitative trading algorithm development. Automated systematic trading strategies through volatility analysis and technical indicator optimization. Engineered backtesting framework evaluating indicator performance across time-series data, generating visual heatmaps identifying high-probability trading strategies.

Summer Intern, **Level39**, London (Summer 2022)

- ❑ Venture capital and startup operations. Supported investor relations and startup onboarding for Europe's largest fintech accelerator.
- ❑ Conducted due diligence on early-stage AI ventures, learned production ML systems implementation (PyTorch-based recommendation systems) from data science teams.
- ❑ Organised founder discussions and managed financial operations (invoicing, accounts management) for incubator companies.

Summer Placement, **Canary Wharf Group**, London (Summer 2018 & 2022)

- ❑ Reported directly to the Board of Directors including Head Architect and President Sir George Iacobescu as a fourteen- and fifteen-year-old.
- ❑ Conducted authorised penetration testing ("legal break-ins") of high-security commercial buildings in collaboration with Estate CyberSecurity Team. Prepared M&A analysis report for CFO and contributed to architectural planning for major London development projects.

Skills

Programming	Python, Typescript, HTML, CSS, SQL, STATA, Ruby.
Tools	Git, LaTeX, Scikit-Learn, Matplotlib, Pandas, NumPy, fastAI, PyTorch, Keras, MATLAB, OpenCV, XGBoost, Kaggle, TensorBoard, Jekyll, Svelte, Docker, Flask, React.
Mathematics	Statistics, Calculus, Linear Algebra, Game Theory, Coding Theory, Statistical Learning, Optimisation Methods.
Algorithmics	Various Search and Ranking Strategies. Learning methods. Q-learning, Policy Iteration, Temporal Difference methods, Policy Iteration, Coordination Mechanisms.
Deep Learning	CNNs, RNNs/LSTMs, Transformers, Generative Adversarial Networks.
